ABSTRACT

RELATIONSHIP BETWEEN PEER SUPPORT WITH STUDENT ENGAGEMENT IN CLASS XI STUDENTS OF SMA NEGERI 2 CITY OF SOLOK

This study aims to determine the relationship between peer support and student engagement in class XI students of SMA Negeri 2 Kota Solok. The independent variable in this study is Peer Support and the dependent variable is Student Engagement. Measuring tools used in this study are the peer support scale and student engagement scale. The sampling technique used in this study was Simple Random Sampling with a total sample of 143 students. The data analysis method used to test the hypothesis in this study was the Product Moment (Pearson) correlation test which was carried out with the help of IBM SPSS 21.0, the coefficient value (r) = 0.611 was obtained with a significant level of correlation (p) = 0.000, because the p sig value was 0.000 < 0.05 then the hypothesis is accepted. These results indicate that there is a positive direction between peer support and student engagement in class XI students of SMA Negeri 2 Kota Solok, meaning that if peer support is high, student engagement is also high. Vice versa, if peer support is low, student engagement will also be low. It means that the research hypothesis can be accepted. The effective contribution of the Peer Support variable to Student Engagement is 31%.
